KEMPSTON (MICRO) ELECTRONICS

Introducing the

ZX81

KLIK-KEYBOARD

This is a full, forty key moving keyboard with real keys that fits in the recess left after peeling off the existing 'touch sensitive' membrane keypad.

It offers the following advantages

- Fits onto the ZX81
- Positive feedback from keys
- No trailing wires
- No special case needed
- Elegant design with two colour legends

This is a most attractive keyboard which will enhance the appearance and improve the performance of your ZX81. Why stay more for an oversized keyboard?

Cheques/Postal orders made payable to:
KEMPSTON ELECTRONICS, 65 ADAMSON COURT,
HILLGROUNDS ROAD, KEMPSTON,
BEDFORD MK42 8QZ.

Other ZX81 products include keyboard two-tone Sleeper CB-95 built, keyboard repeat key kit £2.95 + postage on both items.

ZX81 klik-keyboard kit at £22.50, fully built at £26.00. Please add 70p for postage. Delivery 14 days from receipt of order. SAG in all correspondence please. Proprietor A. Pandey, B.Sc. P.G.C.E.

Subscriptions

You can have Popular Computing Weekly sent to your home: the subscription rate is £19.95 per year, for addresses in the UK.

How to submit articles

Articles which are submitted for publication should not be more than 1000 words long.

All submissions should be typed and a double space should be left between each line.

Programs should, whenever possible, be computer printed.

At present we cannot guarantee to return every submitted article, so please keep a copy.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

Copyright is a vexed subject for software writers and companies alike.

No one likes having their programs copied and marketed without their permission. Quite apart from any question of royalties, there is a matter of pride. The program which you have spent hours slaving over is your baby and no one else's.

Unfortunately, the legal position on software copyright is far from clear. There has yet to be a test case in the courts to establish just what software can and cannot be protected by copyright.

Some software writers have tried to get around this problem by taking out patents on their programs. But there are some doubts as to the effectiveness of this method of software protection.

There have been few reported cases of software misappropriation, but this is no reason for complacency.

There is an obvious need for some form of legal safeguard for software writers. However, for all the publicity surrounding Information Technology 82, there are no signs that the government is doing anything to resolve the problem.

Next Week

It's a matter of life, or death, and the very cells are under your command in this exciting new game

Helix ready to flex their micro-muscles

TWO new computer aids have been produced by Helix International.

The Computer Flowchart Template allows the easy and neat production of 19 flowchart symbols. These have been chosen to conform with the requirements of both the CSE/GCE examinations and the ISO and British Standards. The template is flexible and transparent and costs 75p.

The 40cm stepped-edge Computer Rule, costing 45p, is designed to help read computer print-outs. It incorporates a line reader and line spacing and character/ridge space graduations.

Both are available from normal retail outlets or direct from Helix International, PO Box 15, Lye, Stourbridge, West Midlands.

Sinclair profits are soaring

PRE-TAX profits for Sinclair Research are expected to rise this year to over £10m. This is an increase of £1m over last year. Turnover is also up, showing a five-fold increase over 1981.

New £50 micro challenges ZX81

WEST London electronics firm Binatone is developing a new microcomputer that will cost less than £50.

The Binatone micro will have 16K Ram, colour, sound and a typewriter-style keyboard. It will use a standard version of Microsoft Basic, similar to the Dragon 32.

The Binatone micro is due to go on sale in high street stores by the end of December. With anticipated sales of 400,000, Binatone is planning to compete directly with Sinclair's ZX81 and ZX Spectrum.

UMIST's Microfest

THE Microfest '82 show will be at UMIST on July 24 and 25, admission £1 and 50p. PCW will be there.

Ready to roar into the market place... the Dragon 32.

Will the Dragon be a hit or a myth?

METTOY next month launches its powerful new Dragon 32 micro.

This new home computer with standard 32K Ram, full-size keyboard, colour, graphics and sound, will sell for less than £200 (see the review on page 12.)

Built by Dragon Data — a Mettoy subsidiary — the machine will be sold through the company's established high street retail outlets.

Mettoy, who manufacture Corgi toys, have for some years been concerned about the erosion of traditional toy markets.

Tony Clark, managing director of Dragon Data, who describes himself as a micro enthusiast of long standing,

explained that the Dragon had been "designed very much with the user in mind — we have tried to make the thing as easy to use as possible."

Although early work was conducted by Swansea University, the major design work was carried out by the PAT Centre in Cambridge. This company, a multi-discipline contract research house, started on the design in September 1981.

Mettoy has an established manufacturing base equipped for high-volume production and by the end of the year more than 30,000 units will have been produced.

The Dragon 32 costs £195.95 and will be available in the shops from August 2.

Disc drive hits Beeb add-on list

THE first batch of disc drives for the BBC Model B micros should be on their way to customers by the middle of July.

The 5¼ inch, 80 track, double-sided, double-density discs have a formatted capacity of 108K.

The units are being manufactured by R H Electronics.

For the disc drives to be used with the BBC machine the micro must be modified to incorporate the disc interface. In the production models this will take the form of a Rom. The disc interface has to be fitted by an Aconex dealer.

Cost of the disc drives has not been finalised but should lie around £300. The disc interface and installation cost will be about £10.

According to Aconex's John

in demand... the Beeb drive. CoIl, 17,000 orders for the drives have already been received.

The disc drive is the first of a series of add-ons for the BBC machine.

Joysticks and paddles should follow at the end of July and middle of August.

The first working Z80 card has now been completed and the first production run cards may also lie sent in August.

A speech synthesiser should be out before the autumn and the 16-bit card is also planned for around the same time.

IBM computer secrets sold to Japanese

CONFIDENTIAL details of IBM's latest computer have been stolen and sold to leading Japanese electronic companies.

Eighteen employees of Hitachi and Mitsubishi, six in the US and the rest in Japan, have been issued with arrest warrants by the US Attorney's office in San Francisco.

The accused employees of the two leading Japanese companies are alleged to have paid more than \$648,000 to an undercover FBI agent in return for what IBM describes as "important technical information" relating to the new 3081 computer and 3350 disc drive.

The information, provided voluntarily by IBM, was used by FBI agents to trap the accused. The charges filed for the arrest of senior executives and engineers include the general manager of Hitachi's Kanagawa plant, Mr Kishuro Hekazawa.

Both Hitachi and Mitsubishi have admitted that they have been involved in the purchases of technological information from a Californian consultancy company.

The Tangerine disc is a hit

TANGERINE Computer Systems has launched a new complete disc operating system for the Microtan 65 computer.

Called the Tandos 65, it comprises a low-cost disc controller card, Tandos 65 operating system, disc drive connecting cable and either single or dual 40-track drives.

Tangerine's Paul Kneelman told PCW that he is delighted with the response to the new units.

The costs (exclusive of VAT) of the various parts of the system are as follows: disc controller card — £89; operating system — £35; disc drive connection — £15; single 40-track drive — £219; and dual 40-track drive — £399. Normal 28-day delivery applies in the Tandos 65 system.

Orders and enquiries to: Tangerine Computer Systems Ltd, The Science Park, Milton Road, Cambridge CB4 4BL.

Letters

Technically, he was had!

As I processed an out function from my computer express this morning, taking my usual exit through port W. H. Smith, I was vectored towards the computer magazine Rom shelving by a prominent blue cover.

On page 0 at byte 00C2 were the words BBC graphics. Grabbing a sample of this Rom, I dropped three bytes into the lady's outstretched hand and exited port W. H. Smith on to his Victoria Street.

Later, when all my inter-preters had been cleared, I scanned the new Rom directory to find several bytes missing — namely no BBC graphics.

I trust this new Rom is reprogrammable and will go from strength to strength. But I hesitate to add that you should avoid vectoring busy bits like me into sacrificing my hard-earned bytes in this way.

Save and load — whose fault?

Yet another letter on the subject of difficulties with load and save on the ZX81? I really cannot agree that the difficulties are anything like those which were undoubtedly experienced with the ZX80.

We have a User Group here in Haslocks with at least 20 machines in use and our experience is that with correctly built ZX81s saving and loading programs to and from your own cassette recorder is 95 per cent successful. Loading programs saved on someone else's recorder is less successful due to a variety of causes including dirty heads, misaligned heads, recording levels and tape faults.

However, two of our machines, both Sinclair-built, were supplied with faults. Having built our own machine, and hence possessing

the circuit diagram, I was able to diagnose one fault as a solder bridge between two adjacent pads. This had the effect of diverting over half the output signal into the input (Bar) circuit. Surprisingly, the owners had saved and loaded the old program.

The other fault was the omission of a 47pF capacitor from the output circuit altogether. Again, quite amazingly, there was some signal being recorded on the tape, but it sounded as though it had been played through wet porridge and was quite impossible to load.

Removing the solder in the one case, and fitting the missing component in the other, made two owners very happy. Come on, Uncle Clive, buy your slaves some automatic test equipment — I dare say someone could adapt a ZX81 to do it.

We've failed our own test

In your May 13 Peek & Poke column, Ian Beardmore answered a query on faulty Roms in the Sinclair ZX81 and described two tests to identify the problem. Unfortunately, his second test was inaccurate and has led to some confusion among our customers.

For 10 PRINT 2+32-1 be

says the answer should be 4294967296. As a good Rom is not capable of accuracy in the 10th digit the ZX81 will actually read 300 in the last three digits and not 296. Users getting 300 need have no worries about their ZX81s.

I should add that no ZX81s with faulty Roms were shipped to customers after July 1981 and only a limited number before that date.

London SW1X 8LB

Fingersnapping ZX keyboard

I felt I must write to you to say how impressed I was with the new mini keyboard for the ZX81 which I bought at the Microfair in London on Saturday, May 1.

As soon as I returned home I easily assembled the keyboard and it worked first time. I will never use my old keyboard again. For £24.50 I find this keyboard from Kempston Electronics the best keyboard yet produced because it fits on the ZX81 itself.

I congratulate Mr Pandaal on his product and hope other people were as impressed as I was.

Sickened by Commodore

Having read the news page in *Popular Computing Weekly*, May 6, regarding the twin shocks of the Sinclair Spectrum and the possible 50 percent reduction in the price of the Vic20, I did not know whether to cry, get drunk, open my veins or jump from a tall building. I am a Vic20 owner.

Can we expect a firm statement from Commodore regarding what place the Vic20 will fill in their future range? I know the possible price reduction is too late for us Vic

owners, but I think we deserve some form of reassurance.

It seems crazy to me that for almost half the price that I paid for my Vic, I can buy a superior machine.

Tony Surridge
97 Shelley Road
Chelmsford
Essex CM2 6ES

The quality often varies . . .

I am in possession of all the issues of *Popular Computing Weekly*. The reason for this is that I am interested in saving these programs on cassette with my ZX81.

I thought I had found the ideal magazine at long last. However, I find that I cannot read the programs due to the poor quality of the listings. Also, some of the graphics are impossible to make out.

I hope there is a solution to this problem, or I shall be forced to start looking for another magazine again.

R Fellow
87 Fiddlers Road
London NW2

Another case of them BBC blues

I read with some amusement the lead news item in your June 10 issue which stated that Acorn had cleared its backlog of BBC microcomputers.

I ordered a Model B at the end of January. After three previous delivery dates, I have now been told that it should be dispatched around the end of June.

Looking at the current number of orders per month, I find it highly unlikely that I should be in the 5,000 or so outstanding orders, considering that my microcomputer was ordered so early. Is someone trying to pull the wool over somebody's eyes?

Incidentally, when I last telephoned BL Marketing, at the beginning of June, I was told that the latest reason for delay was that Clestone had gone into liquidation.

London W13

COVER STORY

Time Traveller

Fly your ship through time barriers
in this new game by BORIS ALLAN

You are the navigator of the space-time vessel Sidrat, known affectionately as the *Star Thinker* by her crew.

The Sidrat was damaged when passing through a black hole and is now trapped in a space-time discontinuum. Your instruments are faulty, but you have managed to jury-rig one forward view-screen for limited visibility. The on-board computer charts your progress through the discontinuum.

You are trying to limp home to Veriflag, your home base which is outside time and space. But, there are a few obstacles to your progress.

Firstly, there are the time barriers — high pressure incongruities which abound in the discontinuum. Normally, Sidrat would pass through the time barriers without noticing them, but in her present damaged state they are almost impenetrable. Occasionally, Sidrat will still be able to pass through a time barrier, but there is no way of knowing in advance whether or not you will be successful.

In addition, the Sidrat's sensors are out of action. The time barriers will not appear on the screen until you run into them.

Another hazard is the pirate ship Retzam, a rogue frigate that inhabits the discontinuum looking for easy prey. Retzam will try to stop you from reaching your base by catching you in her vortex. Once inside the vortex, there is no escape.

Finally, a time warp sweeps through the discontinuum at random intervals. Everything in its path is picked up, whirled around and deposited elsewhere in the discontinuum. There is nothing you can do about the time warp, just start again from your new position.

Sidrat is represented on the screen by the letter S. Retzam by the letter R and Veriflag by the letter Y. The time barriers will appear as black squares.

The program, which runs on a 16K ZX81, is written as a series of modules, so it should be fairly easy to convert it to other microcomputers. The initialisation module is contained in lines 260 to 350. To vary the level of difficulty simply adjust the values of the time barriers (TB), time warp (TW) and topological constant (TC).

Lines 889 to 1050 create the discontinuum's topology, details of which are

stored in a two-dimensional matrix AS. The module contained in lines 3000 to 3200 controls the movement of the pirate ship Retzam. Subject to the constraints of the time barriers, Retzam always tries to minimise the distance between herself and Sidrat.

The time warp is activated by the routine in lines 4000 to 4150.

To manoeuvre Sidrat press I for up, M for down, J for left and K for right.

Club Reports

Up among the highlands and bio-rhythms

David Kelly talks to Gordon Hewit of the hyperactive Edinburgh ZX Computer Club

Gordon Hewit often teigs guily about being able to drive a car without understanding the laws of thermodynamics. Similarly, he is unhappy about working with computers without understanding them.

To relieve these unsettling pangs he bought a ZX81.

Having seen a poster for the newly-formed Edinburgh ZX Computer Club, he went along to their third meeting and the unthinkable happened. "Everyone else took a pace back and I found myself on the committee."

The club was formed in June 1981 by John Palmer and Keith Mitchell as an offshoot from the Scottish Amateur Computer Society.

When Gordon first joined the group, it was still in its infancy. All the work was being done by John and Keith and with more than 30 members they were finding it difficult to cope.

For this reason the decision to formalise the group was taken in February 1982. The committee was set up and a membership fee was charged.

The club now has about 50 paid-up members and many more casual non-members who occasionally "breeze in" on club nights. At a typical meeting there may be 10 machines and about 40 members. The meetings are held every month and the club is beginning to outgrow the room which it uses.

Visits have been organised to the Blackford Hill observatory computer suite and the ZX laboratory at Lasswade school.

These now, the club has taken over a corner at the Edinburgh branch of WH Smith in order to demonstrate what a ZX81 can achieve. "People love to learn about their bio-rhythms," says Gordon, "but I don't know if it sells more computers."

He is delighted with the relationship the club has with the shop. As well as letting the group demonstrate the ZX81, WH Smith give out the club's leaflet and newsletter. In this way many new ZX81 owners in Edinburgh are made aware of the club.

Mark Cunningham is the committee member responsible for the newsletter. The bi-monthly publication keeps the members in touch with one another. It has

Glued to the screen... in Scotland

news, product reviews, deadlines and buy-and-sell sections. There are articles written by the members but, as Gordon points out, "Getting the membership into writing is difficult."

The club holds regular day-long Saturday workshop sessions. These have proved so popular that the club is starting to run a series of programming courses.

The ZX Club runs four classes on basic and machine code at both ordinary and advanced levels and a course on basic electronics. Gordon runs the basic machine code class and Robbie McLaren does the advanced machine code tutorials.

Gordon is very committed to the club and he and his fellow committee members have worked hard to make the ZX group a success.

To celebrate their first six months as a formal group they are holding the first Scottish ZX fair.

The idea first came about when a ZX owner in Greenock wrote to a computer magazine suggesting a northern ZX fair. The reply given to the letter said that the enquirer need not worry because there

was to be a fair in Manchester. Gordon says: "We thought — 'If that is the way they think we will never see a Scottish show.'"

So the Edinburgh ZX Club decided to arrange their own fair. The main problem was finding a suitable venue.

"We looked at several church halls," says Gordon, "but they all had only two plug-sockets — one at the front for the band and one at the back for the bar. I thought 'We're going to overload this time for.'"

"We eventually chose Meadowbank Stadium because of the facilities they offer — you can wreck a show by not having anyone selling Coca-Cola."

The one-day fair, which will be held on July 24, will be the first of its kind in Scotland and it has generated a great deal of interest. The booking of stands for the show has been going well and there are now only one or two places for last-minute exhibitors.

Popular Computing Weekly will be at this first Scottish show on July 24. Entry will be 50p and 25p and the fair will be open from 10 am to 5 pm.

Edinburgh ZX Computer Club meets on the second Wednesday of every month between 7.30 and 10.30 pm in the Clarendon Hotel, East Clarendon Crescent, Edinburgh. Membership is £5 per year (Membership for QAPAs under-15s and the unemployed is only £2.50.)

For further details of either the ZX fair or club contact: Gordon Hewit, 3 Baberton Main View, Edinburgh (Tel: 031 442 1163).

What's happening

New Mills Information Technology Group is in the process of being formed. Following their exhibition of new technology at New Mills Town Hall on June 25, the group hopes to hear from those interested in joining a general micro user group. Contact Martin Flahagan, 11 Sundown Close, New Mills (Tel: New Mills 44051).

Norwich and District BBC Micro-Computer User Group meets bi-monthly with workshops and talks, in Norwich City College. Contact Paul Beverley, Room B12a, Norwich City College (Tel: 0603 80011 ext 233).

Mid-Cheshire Computer Club meets on the second Friday of each month in the main Winsford Library (in the Town Centre Precinct) at 7.30 pm. Contact Dave Clare, Providence House, 222 Townfields Road, Winsford, Cheshire, CW9 4AX (Tel: Winsford 51374).

We want to hear from you!

Whether you are starting a new club, holding a special meeting, or just changing the venue, we want to hear from you.

Write to David Kelly, Club News, Popular Computing Weekly, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF or call him on 01-930 3271.

Review

PCW staff present the first review of the Dragon

Enter the

Home computing is a new phenomenon. Its short history has been dominated by a few names, every bit as famous among microcomputer fans as Keegan and Daughlin are to football supporters.

A new name is about to enter the game. The Dragon 32 is firmly placed in the pantheon of the market now dominated by Sinclair, Commodore and the BBC. More details of the Dragon campaign in the news report on page 5.

The Dragon 32 is a single box home computer which can be plugged into an ordinary domestic TV set. Its main features are a 32 column display, compared to 25 on the Commodore Vic-20, full colour sound and high-resolution graphics.

It comes with 32K of Ram and costs £199.50. This compares with the 48K Ram Spectrum at £175 and the 5K Commodore Vic-20 at £199.

The machine is very light and comes in an oversized dragon plastic case. At its highest point the case stands nearly five inches off the table.

A full sized typewriter-style twenty keyboard is built in. On the left hand side of the case is a electronics-type parallel printer port, a cassette socket, a left and a right hand joystick socket, a rest button and a TV socket.

On the right hand side of the computer is a large program cartridge slot. At the rear there is a monitor socket, for higher quality colour graphics, an on/off switch and the power socket.

The keyboard does not include any of the function keys which will now be familiar to all Vic-20 and BBC microcomputer owners. The Clear key is next to the Enter (Return) key. This is a mistake - it is far too easy to hit the Clear key by accident.

There is also no Repeat key or function. This, taken with the lack of function keys and the position of the Clear key, renders the Dragon in many of its possible serious applications.

The resident Basic programming lan-

guage inside the Dragon is one of the most up-to-date 16K versions from the ubiquitous American software house Microsoft. Most of the commands will seem familiar to users of larger machines though they are different from the versions used on the ZX81, Spectrum or Commodore Vic.

We will not explore each of the Basic commands in detail - only those which may be unfamiliar. The Edit facility is very similar to the one available on the BBC microcomputer. Once a line is called down for editing you move the cursor along a duplicate version of the line until you reach the point where you wish to change it.

The cassette operating system is one of the best features of the Dragon. A connector goes into the 5 pin DIN socket on the side of the Dragon to the microphone and remote inputs of any portable tape recorder.

The command **Load** "program name" is used to load programs. When it is being used an S appears in the corner of the screen to indicate that it is searching. When the program is found the program name appears. If there is an error in loading, the machine prints HQ error.

The command **Save** is used to save programs on tape. There is also a useful command **Save** "program name" which loads the program after the one specified. There is no **Verify** command, a feature which has recently become highly fashionable and compensating difficulties there have been in loading tapes from some computers, necessary.

The **Audio** command will connect or disconnect the cassette output to the

speaker on the television set. This is useful for educational software and can be used to great effect in programs such as Adventure.

Open will load a machine code program. **Motor** is used to turn the cassette motor drive on and off when the **Audio** command is being used.

Open is used to open the cassette recorder channel for either input or output. **Close** will shut it.

Self - 1) is an interesting command. It returns a logical True value if the end of the line marker is read off the cassette. **Input** will get data from a cassette file and **Print** can be used to write data to the cassette.

These highly advanced cassette handling commands, together with the computer's ability to interface with a single floppy disc unit, show that the Dragon 32 is considerably more than just a sophisticated toy.

The joystick is supported by a command in Basic called **Joystick** (J). This will return the current position of the left or right-hand joystick depending on the value of J. The value returned by the function is in the range 0-63. Pressing a button on the joystick is detected by **Joystick** a memory address.

The print commands are odd. Both **Print** and **Print** are allowed, which is strange as both commands do the same thing. There are differences in the way the two commands are used, but why are the both necessary? Perhaps we have mixed something. **Print** using is also available.

Exec is very similar to **Use** on other

The internal design of the Dragon (left) is neat and robust. But the keyboard (right) is not good quality and the Clear key is too close to the Enter (Return) key.

Review

EXCLUSIVE!

Dragon

computers. Clear is another strange command but is actually a very good idea. It reserves an amount of Ram at a certain place for string storage.

The sound output from the Dragon lets the whole machine down. There is only one channel and the output is through the TV speaker.

There are two commands for handling this speaker. The first is Sound a,b. This is really no better than the Beep command on the ZX Spectrum. The parameter a specifies the tone to be played, which must be in the range 1 to 255. The parameter b specifies the duration.

The note length can be specified as well as the tempo and there is some control over the volume, which clever programmers will be able to use to envelope their creations.

This all looks very good on paper, but wait until you hear the Dragon play. The Vic-20 has far better sound control with its choice of four voices.

Beside the clever cassette operating system, the other strong point of the Dragon lies in its graphics. The commands which can be used in the high-resolution graphics mode are varied and powerful. More importantly they are extremely fast, especially when compared to the incredibly tedious and faithful speed of the ZX Spectrum.

The high-resolution mode is set with the Pmode command. Within that you can use Screen, to switch the display between the graphics and the text modes; Draw, for drawing. Line, for drawing straight lines; Print, to fill a shape with colour such as a circle drawn with the Circle command.

The smart clean lines of the new Dragon 32 processor.

A number of pages of graphics can be stored in memory. Normally, four different screens can be held in memory at any one time. They can be recalled almost immediately — fast enough to make animation. The number of pages stored in this way can be increased simply by allocating an area of memory.

Another feature which particularly impressed us was the Get and Put commands. Get reads an area of the screen into an array where it can be manipulated. Put will place the contents of such a graphics array on to a specified area of the screen.

The reason why the high resolution graphics are so much faster than those on the Spectrum is probably because the Dragon 32 is built around the Motorola 6900 processor. This was a late entry into the field of 8-bit processors but supposedly combines the strongest features of the 6502 chip, which both Commodore and the BBC use, and the Z80 and Z80A chips used by Sinclair.

The internal design of the machine is strong and efficient. The heat-sink is large enough and far enough away from the main board to ensure that there should be no problems of over-heating.

Summary

The manual is exceedingly poorly written and will prove well-nigh impenetrable to most first-time users. Sinclair and Commodore made the same mistake with their early manuals, but improved on them later — let us hope that Dragon can do the same.

The key question now is whether Dragon will come up with the software emulators and cartridges it has promised, and whether it will be able to supply and manufacture the computer without suffering the hitches and setbacks which have bedevilled other computer companies.

The Dragon 32 should go on sale in selected high street stores from August. More information can be obtained from Dragon Data Ltd, Queensway, Swansea Industrial Estate, Swansea SA5 4EH.

The program cartridge slot (left) is on the right of the computer, while (right, top) the TV output, reset button, joystick ports, tape output and a cassette printer port, are on the left. Power supply input, on/off and monitor output connections (right, bottom) are at the back.

LET ACORNSOFT OPEN THE DOORS TO YOUR IMAGINATION

BBC Microcomputer or Acorn Atom

Acornsoft is the software division of Acorn Computers, designers and manufacturers, of the BBC Micro and Atom. We know better than anyone the capability of the machines. We know how to get the very best from the hardware. And we have produced a range of exciting games, exciting business and useful household software.

The Biggest Range Available

Acornsoft software ranges from authentic arcade games like *Snapper* to Algebraic Manipulation to Desk Diary to other languages like BASIC and LISP, striking, clear and using sound effects and powerful graphics are all used to the full. And it does not stop there. There is a complete range of manuals, accessories and plug-in devices.

Free Brochures

Just clip the coupon or write to us and we will rush our catalogue absolutely free. Can't wait for the post?

range £1.95 to £14.95

A WEEKLY

Discount Club

SPECIAL OFFER

PCW has negotiated a special discount offer on four of the top games cartridges for the Commodore Vic20. The cartridges are manufactured by AudioGenic.

SAVE £7 on Renaissance

PCW price £17.99 (List price £24.99). *Renaissance* is the ultimate Oschell package for the Vic20. Use joystick or keyboard control to play against the Vic. There are eight levels of play. During the game you can change sides and playing level. Take back moves, set up and play special games. You can even save and recall whole games & and from cassette.

SAVE £7 on Meteor Run

PCW price £17.99 (List price £24.99). In *Meteor Run* you must pilot your spaceship through the Meteor belt, blasting your way through the rocks and Alien saucers. Similar to an Asteroids game it includes an early warning radar display.

SAVE £7 on Spiders of Mars

PCW price £17.99 (List price £24.99). In *Spiders of Mars* you are a trapped fly. You must shoot your way across Mars avoiding the dreaded Spiders and the other flying creatures. Accompanied by dramatic music.

SAVE £3 on Cloudburst

PCW price £18.99 (List price £19.99). In *Cloudburst* you must save the Earth from the downpour of Acid raindrops and the invasion of the mutant Cloud Hoppers. Speed and skill are essential. With original music and ten levels of play.

To have these top cartridges sent to your home all you have to do is fill in the form below and send it off to Popular Computing Weekly.

hardware

Q5 Chr\$ board

Quickshiva: 85 Brownhill Road, Maybush Southampton, Hants
Price £26.00

This board allows you to reprogram the 128 characters making up the Sinclair character set at will.

The printed circuit board has to plug into a motherboard or Quickshiva connector (two edge-connector sockets back-to-back) as it does not have a single connector.

Once fitted, it can change the appearance of any character on the screen determined by a switch on the board. A tape provided with the characters board provides the software to run it in the form of a set of Rem statements at the beginning of the program, but this need not waste any of your program Rems as, once the character generator has been programmed, the whole program can be Newd leaving the character set intact. Restoring the switch means that you have the original character set back if, for example, you want to change the program.

The characters board also includes a program which produces a lower-case set of letters with proper descenders in place of the inverse letters. Therefore, the ZX80 (with 8K Ram) or ZX81 may be used as a typewriter. The ZX80, however, requires a hardware modification to the ZX80 printed circuit so that a Rom C5 line may be added to pin 23B.

The instructions and tape are superb and Quickshiva have now combined forces with Artic to produce a chess program with proper pieces using the characters board.

On the board is 1K of Ram starting at address 33792 and, when the characters board is not required, this may be used to store machine code.

The uses of the characters board are not limited to those indicated by Quickshiva and the instructions included show how to program your own characters which could be scientific symbols or even hi-resolution characters. **SA**

Mastering computing

Macmillan, boards
Price £9.95 (hardback)

Here two new titles in Macmillan's marvellous "Master" series are considered.

The books are *Computers* by G. Wright (paperback £2.75, 212pp) and *Computer programming* by M. Gosling (paperback £2.85).

Both are of interest if you've not got many computing books and would like to increase your background library. But — be warned — computing books can never

be satisfactory! The same is true of French books or physics books: the needs of each reader are different. In the case of computing we also have the twin problems that the subject is both new and fast changing.

Wright's book has a desired start towards the business user rather than the hobbyist! The basic facts are the same, of course, but the examples are more restricted than they need be. Still if you want the basic facts — how the computer works, what it does, what the different bits do, what systems analysis and data processing are and so on — then this book has all that, and more. He includes chapters on social aspects (unemployment, privacy etc) and what the future with computers could be like. Well illustrated, well written. Useful.

Gosling's book is good, too — but it carries the wrong title. It is 90 per cent about programming in Basic with only brief (but excellent) details of other approaches (assembler, Fortran, Cobol, Pascal). Like almost all basic programming texts it tries to be machine-independent and actually is therefore most unsophisticated. In essence the Basic covered is that comprehensible with terminals — nothing meaning! In graphics, Peek, Poke and colour or sound. There are plenty of carefully developed programs, but unless you are a terminal user you will probably find a book specific to your machine much more helpful.

Summary

Computers is a useful general account but based towards business applications. Computer programming is good on simple Basic but would offer little to the personal micro user. **KJ**

Maplin ZX81 keyboard

Maplin Electronics, PO Box 3, Rayleigh Essex S86 6LR Tel: 0707 552911.
Price £19.95

This is a kit for constructors wishing to add

a keyboard to a ZX81. It was designed for Maplin as a project to go into their quarterly magazine. There are 28 keys, of which six are larger than the rest. Those are Q, P, NEWLINE, space keys and three keys which lock on a special function. The special keys are FUNCTION, SHIFT lock and GRAPHICS 2. They all require some electronics which are located on the right-hand side of the keyboard along with a power supply from the ZX81.

The keyboard dimensions are 13.5in x 4.5in.

The power supply connection is unique as it is a two-hole adaptor to one 3.5mm plug, so that both the power supply from the Sinclair Power Pack and the keyboard can be plugged in the 3.5mm plug going into the power socket on the ZX81. This and the fact that the keyboard connections are wires which locate into the ZX81's keyboard sockets mean that no soldering is necessary on the ZX81.

The special function keys all "lock" into position until they are pressed again so that, say, a whole string of graphics can be written without having to hold down the SHIFT key. The fact that the function is locked-in is indicated by two lights (both red), and it would have been better if these had been different colours.

The keyboard is fairly easy to build for someone with a bit of kit-building behind them, but I would not recommend it for the absolute beginner. The keys need careful alignment before soldering them into position, so it would have been better if the instructions had given details of how to put the key tops on before soldering the keys to the board. The space key arrived with not enough holes to fit the two keys it fits over, but Maplin say that this has been corrected and that anyone with the problem will get a replacement if they contact them.

The keyboard is quite delicate and Maplin will provide a case for £4.95.

The keyboard and case is also available from Maplin in Hammersmith and Weekcliffe-on-Sea. **SA**

Maplin's 43-key typewriter board for the ZX81

Open Forum

Open Forum is for you to publish your programs and ideas. It is important that your programs are bug free before you send them in. We cannot test all of them. Contributions should be sent to: Popular Computing Weekly, Hobhouse Court, 19 Whitecomb Street, London WC2H 7HF.

How to contribute

Each week the editor goes through all the programs that you send to Open Forum in order to find the Program of the Week.

The author of that program will qualify for DOUBLE the usual fee we pay for published programs.
(The usual fee is £10.)

Presentation hints

Programs which are most likely to be considered for the Program of the Week will be computer printed and accompanied by a cassette.

The program will be well documented, the documentation being typed with a double spacing between each line. The documentation should start with a general description of the program and then give some detail of how the program has been constructed and of its special features.

Listings taken from a ZX Printer should be cut into convenient lengths and carefully stuck down on to white paper, avoiding any creasing.

Please enclose a stamped, self-addressed envelope.

Escape

on ZX81

This is a game for the ZX81 where you have to move your man to one of the four exits and escape. Your score is given when you get out.

The doors are represented by the - signs and you are the O which starts in the middle of the screen. An earthquake which opens up holes at your feet hinders your escape. If you fall down a hole you will die and fail in your task.

First the doors are printed and then some holes appear on the screen. When the O appears you can move using the cursor keys 5, 6, 7 and 8. After moving a few squares you will be forced to stop and more holes will be formed. You will then be able to move another few squares.

You cannot move while the holes are forming. If a hole appears at the exit you are moving towards, you can try and make to next page

your way fill another door. The symbol 'a' represents a 'graphics shift A' character.

The following outline gives a brief explanation of the program.

Lines 1 to 50 set up the variables and doors.
Lines 60 to 80 set the holes. To make the game easier, I placed the 100-kg ship in line 60.
Lines 90 to 160 move you, set the score and detect whether you have released a hole or made it to a door.

Lines 200 to 240 show how well you have done.
Lines 250 to 320 give the score. The high score and asks if you want another game.

Nimrod

on Vic-20

Although this program is written for the unexpanded Vic-20 it uses high resolution graphics to draw the characteristic outline of the Nimrod anti-submarine aircraft, its bombs, and the target submarine.

Compilation takes about 15 seconds at the start of the program. The Nimrod and the submarine proceed across the screen in opposite directions, the player dropping bombs from the Nimrod by pressing key B.

Unfortunately for the bomb aimer, as the aircraft remains on task it cruise-drops to save fuel. Also the submarine cruises at greater depths to make attack more difficult.

If the Nimrod is at all successful the game speeds up. Hits are rewarded by suitable flashes and bangs, and the player is given two cycles of 10 passes to attempt to hit as many submarines as possible.

Lines 2 to 5 form and store the high resolution graphics characters. Line 10 sets up the screen and line 15 defines the start positions for the Nimrod, submarine and bomb. Lines 20 and 25 position and colour the Nimrod and the submarine.

Line 30 controls the speed of movement of the characters, note that the timing is linked to the score 2 so that as the score mounts the game becomes progressively more difficult. Line 30 also initiates the white noise representing aircraft and submarine engines.

Line 35 tests for a bomb release and line 40 tests for a bomb already in flight. The number of cycles of the program is controlled by line 65. Line 65 draws and colours the bomb and controls its trajectory.

The sea is redrawn after the bomb splash by line 70. Line 75 tests for a hit and line 80 tests for a bomb on the sea bed. Lines 90 and 95 make the explosion, flash the screen, and increment the score if the bomb hits the target.

Here are the variables used:

AS: Test for bomb release

BS: Test for game start

S: Submarine start position in location map

- Y Number of program cycles

Polar Co-ordinate

on BBC Micro

This program runs on a BBC micro model A or B. When run it asks for an equation involving some angle X, eg $1 + \sin X$. This will plot a circle.

It then asks for a scale within indicated values. If the maximum value is used the plot should just fit the screen. If smaller values are used correspondingly smaller plots will result.

Some interesting functions to try are:

```

COS 2*X
SIN 3*X
COS X/2
6+50*X
20-COS X
    
```

When the plot is complete it will turn from green to blue and a prompt for a further function will be displayed. The program as it stands runs in MODE 4, but could be changed to run in any available graphics mode; see line 60.

Brickout

on VIC 20

This version of Brickout will work on any Vic and includes a high score feature and four levels of play. Maximum points possible are — Level 1: 300 points, Level 2: 600 points, Level 3: 900 points, Level 4: 1200 points. The number of balls left is printed each time a ball is missed.

Program notes

- 40-60 Checks where Basic Program starts. Peak (400-10) + at least 8K memory expansion is present. If starting position of lower character memory (1) value to be added to it to obtain screen colour location
- 60-150 Draw wall and surround
- 150 Draw ball
- 200 Position ball in random spot to left of wall
- 250 Put out ball
- 290 Compute new position of ball
- 290 Checks for obstacle in path of ball
- 300 Detects ball in new position
- 310 Brackets to ball memory locations for number of times dependent on ball level
- 400 Checks when obstacle ball has met
- 410 Ball hits side surround
- 400-450 Ball hits ball. Ball rebounds according to which part of ball is hit
- 450 Ball hits wall
- 470-475 Ball hits back surround
- 480-510 Ball missed by ball

ZX CHESS & ADVENTURES

PROGRAMS FOR THE ZX81/80 INCLUDING

ZX FORTH

For those who want to learn more about the ZX81/80, this is the program to get. It includes a full set of instructions and examples.

THE BYTE RAM PACK

£31.95

This pack contains a full set of instructions and examples for the ZX81/80.

16 (X) CHESS

£2.95

This is a full set of instructions and examples for the ZX81/80.

ADVENTURES ADVENTURE 'A'

£5.00

ADVENTURE 'B'

£7.00

ADVENTURE 'C'

£8.00

Each of these three adventures is a full set of instructions and examples for the ZX81/80. They are designed to be played on the ZX81/80 and are suitable for all ages.

GALAXIANS £3.95

All the features of the other games in this set, but with a new program.

Shopping, adventure, exploration and production.

ZXBUG £7.00

A full set of instructions and examples for the ZX81/80.

and search through and modify memory, with various routines.

Open Forum

World Cup

on ZX81

World Cup was written for the World Cup in June. The object of the game is to stop as many of the balls as possible from entering your goal. You have to try and stop 10 balls and your score will be displayed after each ball.

You can change the number of balls by changing the IF statement in line 230. To make the game even harder you could renumber line 90 to line 145.

The variables used in the game are

- T - To give you the score after every ball that has been scored
- X - Down you the row in which the ball appears
- Y - The column in which the ball appears
- C - The number of balls you have to stop
- P - The column in which the ball is when it goes into the goal
- A - The column where the ball is when it enters the goal
- B - The row in which the ball is

Dice Thrower

on ZX81

This automatic dice thrower program for the unexpanded ZX81 generates two random dice scores. This program can either be incorporated into larger programs as a sub-routine, or used on its own for dice and card games.

The dots on the die are printed together with their combined scores. To throw the dice again simply press Nowline.

World Cup

Dice Thrower

by Kenneth Hart

Win the great new ZX Spectrum

All you have to do to enter this award scheme is send us a program in one of the following categories: (a) Games; (b) Educational-Scientific; (c) Business/Office; (d) Utility.

Programs for each category should be accompanied by a cassette, a copy of the listing and full documentation. Points will be awarded for use of machine code, innovation, structure and ease of use.

The overall winner will receive a ZX Spectrum and Printer. Individual category winners will be awarded £30 of software, and 24 runners-up will receive programming merit awards.

A competition coupon will be published in each issue of Popular Computing Weekly for the next three weeks. To enter the competition, you must send in your program together with any four differently numbered coupons to:

Popular Computing Weekly,
Programming Award Scheme,
Hobhouse Court,
19 Whitcomb Street,
London WC2.

Rules

- 1 There is no limit on the number of entries you can send in, but each entry must be accompanied by four differently numbered competition coupons.

- 2 Closing date for entries is August 1982.
- 3 The names of the winners will be published in the September 1982 issue of Popular Computing Weekly.
- 4 The Judges' decision is final.
- 5 No employees of Software Publications Ltd or their relatives will be eligible to enter the competition.

Popular Computing Weekly Programming Award Scheme

Fill in this coupon. When you have collected four differently numbered coupons, send them with your program to: Popular Computing Weekly, Programming Award Scheme, Hobhouse Court, 19 Whitcomb Street, London WC2.

Programming

Matching the psychology of a computer

Boris Allan presents a games program for the ZX81 that learns as it plays.

Stone thrums scissors, but paper wraps stone, and scissors cut paper. Stone beats scissors, paper beats stone, scissors beats paper.

This is a very old game, where the stone is a fist, paper is a flat hand and scissors are two open fingers. Basically it is a game of psychology. In many there is no way of predicting what your opponent will do next, but quite often you can make a good guess. The psychology comes in having your own pattern of behaviour while trying to break down your opponent's pattern.

This version of the game is called rock, scissors, tissue because the initials R,S,T are in consecutive order in the alphabet. The program just fits in a 1K ZX81.

This program is a learning program. It enables the computer to remember how many times the opponent has played a certain move. The computer takes the player's last move, isolates his next most likely move and works out the correct response.

Information about the moves is stored in a 3 by 3 matrix A. The cell A(L,Y) contains the number of times when the last move L was followed by move Y.

In this matrix 1 corresponds to rock, 2 corresponds to scissors, and 3 corresponds to tissue. Thus A(2,3) is the cell for last move scissors and next move tissue.

On the ZX81, code R is 55, code S is 56, and code T is 57. If 54 is subtracted from the code value for the initial letter, then R, S and T become 1, 2 and 3.

As rock (1) beats scissors (2), scissors (2) beats tissue (3), and tissue (3) beats rock (1), we can see a pattern emerging. If the value of the computer's move is one greater than the value of the player's move, then the computer loses (assuming that 3+1 is regarded as equal to 1). Therefore, if the computer predicts that the player is most likely to make a certain move, it adds 2 on to the value of that move to get the winning response.

The program starts by setting I=1, J=2, and K=3. Lines 130 to 150 then make initial assignments to the variables, after setting a non-repeating random start by RAND.

The variable I is used to record the

3030 INPUT Y$
3040 GOTO 990
```

player's last move. Line 140 gives it an initial random value from line 5. Variable Y, the player's present move, is given a random starting value by line 150. These two values are then used to enter random Ts in the move matrix, giving the program an in-built, but unknown, bias. Line 990 clears the screen and starts the move routine.

Lines 1000 and 1010 search through the

three elements on row Y of the move matrix to find the largest number. This shows the most popular combination used so far by the player. After move Y he is most likely to make move N. Given the player's most likely move, line 1000 calculates the computer's response.

Line 3000 determines who has won. If W=1 then the computer wins, but if W=2 then the player wins.

Spectrum

In this new slot various contributors explore different aspects of the ZX Spectrum.

From fans to the third dimension . . .

Nick Hampshire continues his series on graphics with some standard 3D programs.

Last week I presented two relatively simple programs for rotating a graphic image on the Spectrum. The first simply moved a single point around the screen in a circle. This was a development of our attempts to bypass the Spectrum's circle command which, as we have discovered, has a number of disadvantages.

The second program was simply a variation of the first program. It rotates a line stretching out from the centre of the screen around that point.

The first program this week, Figure 1, takes the program a stage further in trying to create the impression of a rotating fan. I have added the colour just for effect — it has no material place in the program. You may, however, like to try changing the colour yourself to make the image more exciting.

Figures 2 and 3 are simply a couple of

fairly standard 3D graphics routines which I have tried on the Spectrum. As you can see, the functions are contained in line 60 in both programs. It is interesting to try these programs on the Spectrum simply to give yourself an idea of how fast, or from some points of view how slow, the Spectrum is.

As you can see from the two programs, it is quite straightforward to change the functions in line 60 to create different images.

Just for fun I have thrown in Figure 4 which creates random blocks of colour on the screen.

As you will have seen on the news pages the Spectrum's new going out are being modified to overcome the clash on the data bus between the ULA and the Z80A CPU which we reported three weeks ago. We now have one of the first production batches which has the new modification hand soldered in. By now the modification should be built into the production run.

The modification gives priority to the Z80A over the ULA when both are trying to use the same data line in other respects the production version of the Spectrum appears to be the same as the pre-production models which we have, to date, been using for this page.

The only difference which we have noted is that Sinclair, in response to the

criticism in the Popular Computing Weekly review of the machine, in Vol 1 No. 3, has increased the size of the characters on the keys. The red legends are still difficult to read in poor lighting, but the change is an improvement.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Sound & vision

**In tune with
the season?**

This program, written on a BBC Micro Model A with 128k, uses the sound function available on the BBC Micro to play the tune "The Green Leaves of Summer".

It uses two lists -- one for A-sharp and notes from A sharp and B (octave 4, lowest notes), through E-flat octaves 2 to 6), to G, C sharp and D in octave 7 (highest notes). The format for this list is:

Grav. S. (1) A. 1

Code 5 (2) B1

Code	\$ (3)	G2
------	--------	----

Code 5 (4) C # 2

10

Code 5 (B5) D7

The last figure denotes the octave num-

ber and an octave goes from C, C # etc to B. Flat notes are denoted as the sharp of the note below it ie to get B flat use A sharp.

The frequency table set up at line 80 defines frequencies for Sound commands corresponding to notes. Start the data table by assigning the octave in which the following notes are to be played (ie Q3 assigns the following notes to octave 3). The format of the music data table is the octave (ie Q3) then the note and time duration. D2 is note D lasting 2 time units. G6 is note G lasting 6 time units. MAX 9 time units.

It is very important not to include spaces at the end of the data table as the program will not recognise it. Instead, it will print "No match! Note = ". This is useful as it tells you immediately which note has been created.

In the Sound command in line 310 the `f = 15000` and `t = 5` is explained by `f` which is there is always `f = 15000` is the volume freq. (Hz) determines the tone, and `t = 5` is the time duration in dma units.

To change the speed of the music, change the value of `rate` line 310. At the moment it is `1 * 5`. Changing it to `1 * 4` would speed it up, and `1 * 6` would slow it down.

To change the volume, change the '-15' in line 310. The volume ranged from -0 to -15, -15 being the loudest.

If you want to alter the actual tune played by the computer, change the values in the data table which begins at line 330. To help you find the notes, use the following table.

Although the program was written on a 32K machine, it will run on a 16K machine. Also, at the moment the program restores and plays again. To stop this type 'end' instead of '70' in line 270.

Peek & poke

Peek your problems to our address. Ian Beardsmore will poke back an answer.

NOW I'VE GOT ONE, WHAT DO I DO?

S. Alg. of Wandsworth Bridge Road, Putnam, London, W8 7NF.

Q I own a BBC micro-computer and would like to know how to get the teletext graphics. The user guide does not even mention the subject.

A Secondly, could you please tell me how to turn off the BBC machine's cursor. I have tried (70E1=0), but it showed no sign of working.

A To use the teletext graphics you have to be in mode 7. To change into the teletext colours enter PRINT CHR\$(129); this will change that line of text to red. You will have to enter this at the start of each line you want to use the colour on.

If you want to use the actual graphics then add 16 to the number that will change the text colour. Thus PRINT CHR\$(145); will mean that all characters after this statement on the line will be in red. Again, this statement will have to be entered on every line where you want to use the teletext graphics. The complete list of codes is:

CODE	COLOUR	GRAPHIC CODE
129	RED	145
130	GREEN	146
131	YELLOW	147
132	BLUE	148
133	MAGENTA	149
134	CYAN	150
135	BROWN	151

The form you quote for turning the cursor off is based on the form used on the Acorn Atom. The BBC machine is quite different. Use the following:

VDU 22=0;0;0;0

SEEING THINGS IN BLACK AND WHITE

Ian Jones of Woodside Road, Brixton, London.

Q Not long ago I read in a magazine that there are certain PCB changes suggested by Sinclair which can be made to the ZX81 to change the screen output from black characters on a white background to white characters on

a black background. This reduces the eye strain considerably. Have you any idea what these changes are?

A The short answer is no. The black on white screen format of the ZX81 is stored in the chip itself, and so is effectively impossible to change. Are you sure that you have not got it muddled up with the ZX80 which could be changed by altering the PCB?

IT'S BASIC BUT IT'S NOT BASIC ENOUGH

M. F. Gries of Chesham Street, Salford in Ashfield, Wales.

Q I have recently purchased a ZX81. Unfortunately, I am having difficulty in understanding the users handbook. Could you tell me if there is a publication that would simplify the Sinclair Basic?

A Also, is it possible to use the ZX81 to store a collection of 5,000 records?

A With 30 to 40 books on the market all trying to simplify the handbook, it is not easy to choose a particular book. Some would only make things worse while others need a certain amount of knowledge before they become of any use.

The two books which I feel would be of most use to you are *Getting Acquainted With Your ZX81* by Tim Hartnell, and *Byteing Deeper Into Your ZX81* by Mark Harrison. Tim's book is a simple jargon-free primer that will teach you quite a few of the ground rules, almost without you realising it. Mark Harrison's book is more of a teach yourself book. It has fewer programs than *Getting Acquainted With Your ZX81*, but it deals systematically with all aspects of the ZX81 from switching on to machine code.

Between these two books should teach you all the manual tells us, and some more besides. *Getting Acquainted With Your ZX81* can be obtained from Interface, 44-46 Earl's Court Road, London W6 6EL. *Byteing Deeper*

Into Your ZX81, published by Sigma Technical Press, is available from Dillons University Bookshop, Malet Street, London WC1.

If your ZX81 is unexpanded, it would take such a vast number of cassette tapes to store the information, that the system would become unmanageable. Even with a 16K RAM pack, it would still need a large amount of soft and many tapes.

To make such a large amount of storage really viable you would need one of the large add-on RAM packs such as the Memotech 48K or the 64K from Audio Computers. Even better would be the Monolith disc drive, but this costs far more than the ZX81 itself.

It might be better to wait until the ZX Microdrive comes out, because it will almost certainly be possible to interface the microdrive with the ZX81. This will probably take until Christmas, but by then you should have a lot more knowledge about computers.

PLAYING DIRTY IN THE RIGHT SPIRIT

T. S. Chandru of High Street, Walthamstow, London, writes.

Q I have recently purchased a ZX81 with RAM pack. However, I have noticed that the expansion port at the back of the ZX81 has become dirty owing to oxidation.

I have consulted various books on the matter, and one says that when the copper fingers covered in silver solder become dirty the only way to clean them is with methylated spirits. However, the book says that you should use industrial methylated spirits and I can only find the mineralised type which has a purple dye. I looked up both types and found that the clear industrial type does not have 0.5 per cent pyridine, or the purple dye.

I am worried that if I use the methylated spirits with the dye it might contaminate the connections, making the ZX81 useless with the 16K RAM

Can you please advise whether I can use this sort of methylated spirit, and if not, where can I get the industrial type?

A You need not worry about using methylated spirit, mineralised or industrial. The violet dye is inert and pyridine is no cause for concern either. It is slightly alkaline and soluble in water, alcohol, and fatty acids, and is considered safe enough to be used as a solvent. The only reason that it is not used in some industrial forms of methylated spirit is that a pure alcohol is needed.

GETTING HUNG-UP ON THE SCORE DRAWS

J. Ashbourne of Cherry Street, Wilmslow, Cheshire.

Q I have a ZX81 fitted with a 32K memory. Together with a colleague I have written a program which we intend to use for the football pools.

The program consists of an array A\$ of 2187 lines of 8 numbers, and an array B\$ of 55 lines of 8 numbers. Two loops delete all the lines of A\$ that do not agree with each line of B\$ in any of the eight positions. The remaining A\$ lines are left as printed.

The lines of the arrays only consist of numbers between one and three, but it takes so long to process the 55 lines of the B\$ array that the program as it stands is useless. We have to repeat it about seven times to complete the operation. What we have in mind is loading the program from tape each time as the array B\$ is always different. If we then typed in GOTO 60, followed by the new batch of 55 lines, will this overwrite the old array?

A What you say is correct. You will have to use GOTO because RUN will delete the variable A\$ which you want to keep.

As a further safeguard, you might find it useful to edit out the initialisation part of the program that actually inputs the value of A\$. This is covered on page 146 of the manual.

Competitions

Puzzle No 12

There was a sensation (silently) at Greyfriars School, when it was discovered that there had been a midnight raid on the luck shop, and a large box of fudge had been taken.

No amount of threats could reveal the culprit but certain boys, namely Beedle, DeVore, Farrer, Heeley, Lowell, Nanson, O'Toole and Strud, were unable to account for their whereabouts at the relevant time.

An anonymous note was later found, and it heavily disguised writing it read:

"The other night when all were fast asleep Across the moonlit lawn I saw a figure creep, To tell on fellow pupil is not my game, But if you take the letters of his name, And, with numbers, substitute for letters there,

He is the one that gives the largest square." Who dunnit?

Solution to Puzzle No. 5

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Although parts (a) and (b) can be solved in one continuous program, which lists each of the 36 possible throws obtainable with two dice, together with the scores, to find the answer to (c) it is necessary to play the game. A program has to be written to draw the board and play the game by placing and removing counters.

In the diagram above, each square on the

board is defined by its unique fourcolumn number, which also serves as a PRINT AT location. The sequence in which the squares are traversed can be entered as the rather long string AS. Thus if we keep a tally of the cumulative dice score played, T, then the exact location that we are at can be found by the lines:

LET C = VAL ABS(T - 1)

LET C = VAL ABS(T)

Then PRINT AT LC, "O" will place the counter at this location.

A DIB statement can be used to keep a tally on the squares visited (by making them non-zero), so that they can be checked during the second stage of the game in order to determine whether to place a counter or to remove one already on that square.

The showers are as follows:

- Lowest score — a throw of 2 and 4 gives a score of 6;
- Highest score — a throw of 2 and 6 gives a score of 27;
- Throws of 1 and 2, and 3 and 1, both give identical "outplayed (disadvantaged)" patterns. (Other interesting patterns are generated with throws of 1 and 5, 2 and 1, 2 and 5, and double 4.)

Winner of Puzzle No. 4

The winner is: R J Viney, Station Road, Oatham, Rutland, who receives £10.

Solution to Crossword No. 5

Across: 4 Acorn, 7 Package, 8 Attack, 10 Agape, 12 Sump, 13 Even out, 14 Blind, 15 Hindu, 16 Levers, 20 Fingers, 21 Scoops.
Down: 1 Tangerine, 2 Skipped, 3 Ego, 5 Cut, 6 Ha, 8 Arton, 9 Commodore, 11 Texas, 12 Strings, 17 Vic, 18 Rip, 19 Dim.

Winner of Crossword No. 6

There was no correct entry to Crossword No. 5.

Crossword No 12

ACROSS

- 1 First eaten with Salmon (5)
- 2 Severe pain from arthritic joint (7)
- 3 Output device that obscures (5)
- 4 Turkish beer making organisation known (5)
- 5 Dainty dish to eat (5)
- 6 As laid up in the sun (5)
- 7 Ten mass found in a clock face (1,2)
- 8 Superman's alias who created 2001 (5)
- 9 Game characters that haven't been defeated (5)
- 10 Ministry line for officer (5)
- 11 Supernatural being in strange language (5)

DOWN

- 1 Spin and dream making biscuits (5)
- 2 Press a stop into becoming a superhero (5)
- 3 Eggs that are open (5)
- 4 Cool storage unit (5)
- 5 A game using 16 square tiles (5)
- 6 A 15. Squashier names arrangement with 10 (5)
- 7 One of three parts, cheaper (5)
- 8 One about a number of times (5)
- 9 Complete reference, with title holding a student (7)
- 10 Foul of the count, hang (5)
- 11 Eggs not English eggs (5)
- 12 See 8.

CITIZEN PAIN

COMPUTING

April/May 1982 £1.25

An exciting new Commodore peripheral

Own or use a Pet or a Vic?
Fed up with being ignored by all the
traditional monthly magazines?

Fed up with listings, which are too simple
or simply do not work?

You need *Commodore Computing*, the new
monthly magazine. *Commodore Computing*
is published by Nick Hampshire, author of
The Pet Revealed, *Pet Graphics*, *A Library*
Subroutines and *The Vic Revealed*.

Each issue is packed with advanced

advice on how to make the most of your
computer, whether you use a Pet or a Vic.

Each issue covers a host of applications
— software, hardware, machine code, games,
business use — whatever it is you'll find it in
Commodore Computing.

If you want to learn more about your
computer, take out a subscription to
Commodore Computing.

That's the only way to get it, and get it
straight.

Send £12.50 for 1 year's subscription (10 issues) to:

Commodore Computing,
Magsub, Oakfield House, Perrymount Road, Haywards Heath, Sussex RH16 3DH
